INTRODUCTION TO MACROECONOMICS

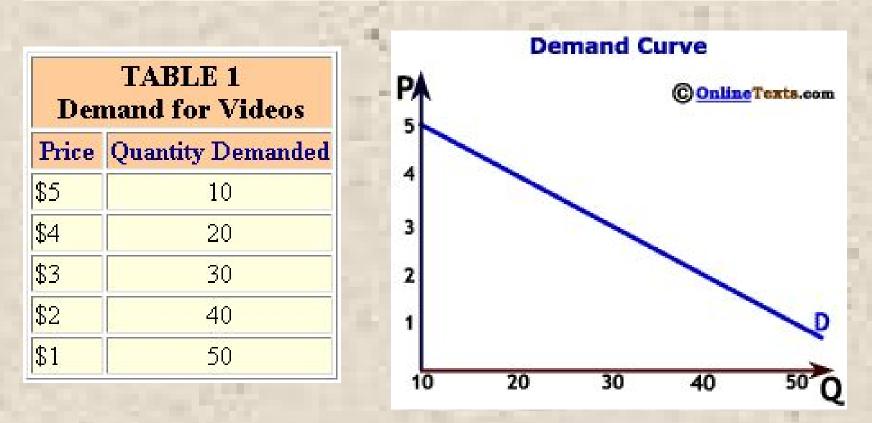

#### Chapter 5

# **Supply and Demand**

### The Law of Demand

- The *law of demand* holds that other things equal, as the price of a good or service rises, its quantity demanded falls.
  - The reverse is also true: as the price of a good or service falls, its quantity demanded increases.

### **Demand Curve**

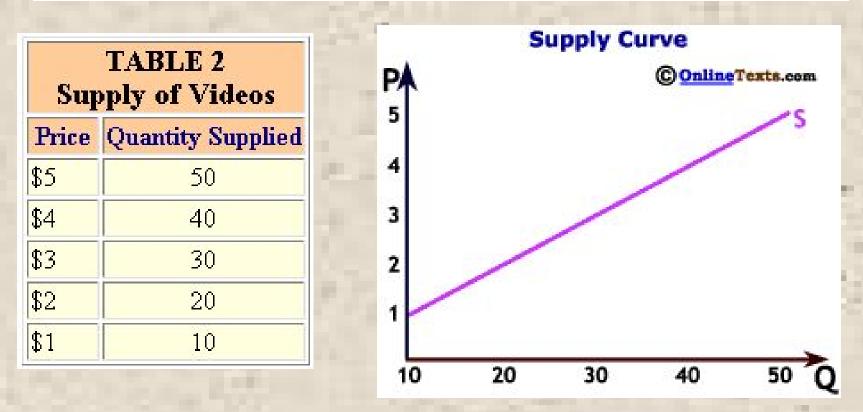

The demand curve has a negative slope, consistent with the law of demand.

# The Law of Supply

- The *law of supply* holds that other things equal, as the price of a good rises, its quantity supplied will rise, and vice versa.
- Why do producers produce more output when prices rise?
  - They seek higher profits
  - They can cover higher marginal costs of production

# **Supply Curve**

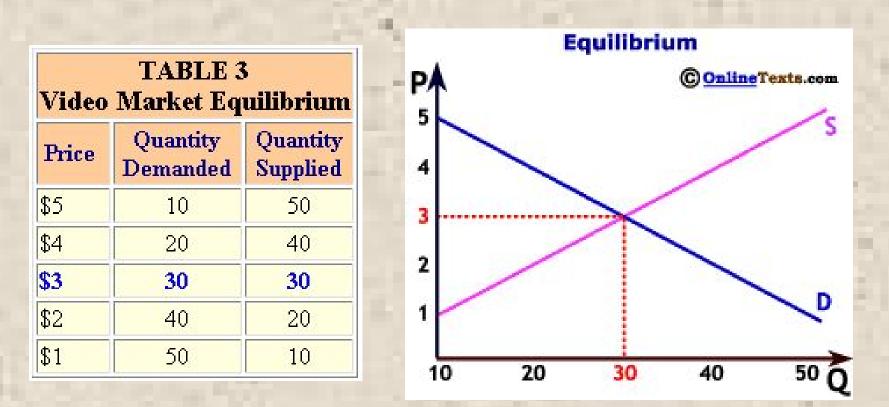

The supply curve has a positive slope, consistent with the law of supply.

# Equilibrium

- In economics, an *equilibrium* is a situation in which:
  - there is no inherent tendency to change,
  - quantity demanded equals quantity supplied, and
  - the market just clears.

## Equilibrium

Equilibrium occurs at a price of \$3 and a quantity of 30 units.

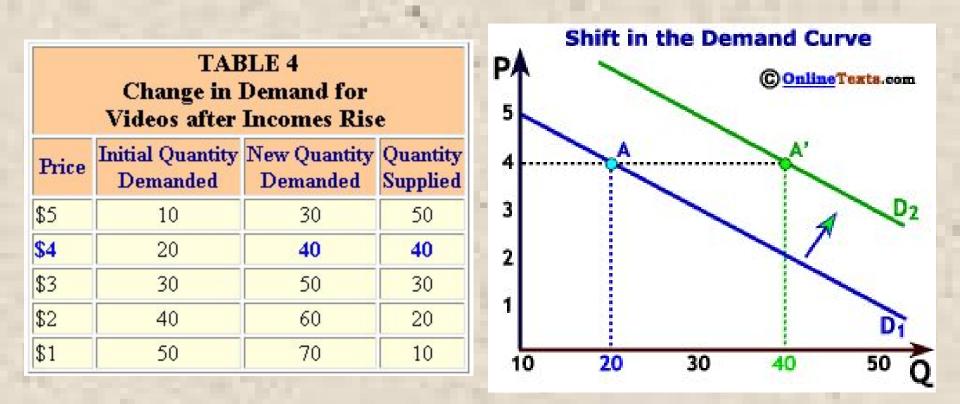

# **Shortages and Surpluses**

- A *shortage* occurs when quantity demanded exceeds quantity supplied.
  - A shortage implies the market price is too low.
- A *surplus* occurs when quantity supplied exceeds quantity demanded.
  - A surplus implies the market price is too high.

### Shift in the Demand Curve

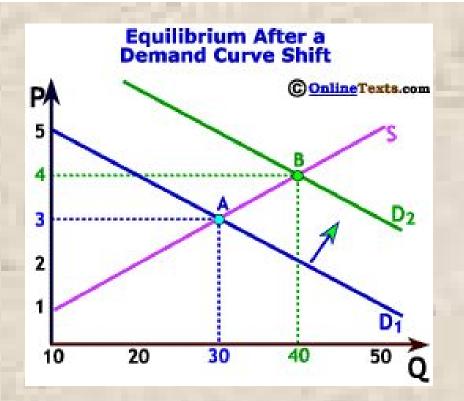

- A change in any variable other than price that influences quantity demanded produces a *shift in the demand curve* or a change in demand.
- Factors that shift the demand curve include:
  - Change in consumer incomes
  - Population change
  - Consumer preferences
  - Prices of related goods:
    - Substitutes: goods consumed in place of one another
    - Complements: goods consumed jointly

#### Shift in the Demand Curve

This demand curve has shifted to the right. Quantity demanded is now higher at any given price.

### **Equilibrium After a Demand Shift**

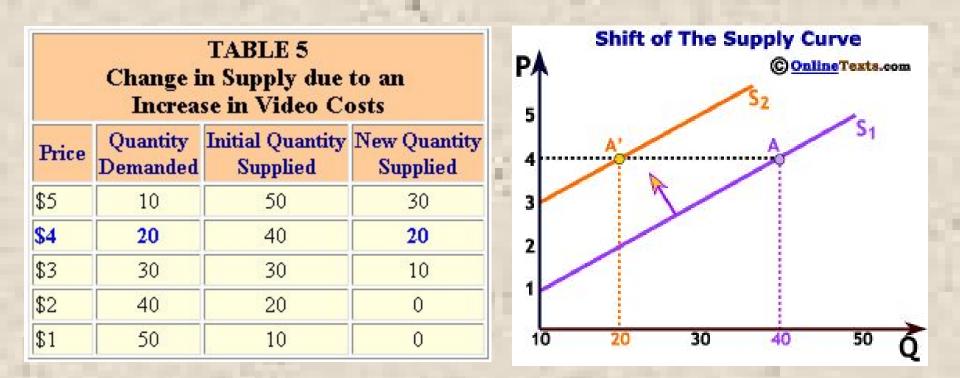

The shift in the demand curve moves the market equilibrium from point A to point B, resulting in a higher price and higher quantity.

# Shift in the Supply Curve

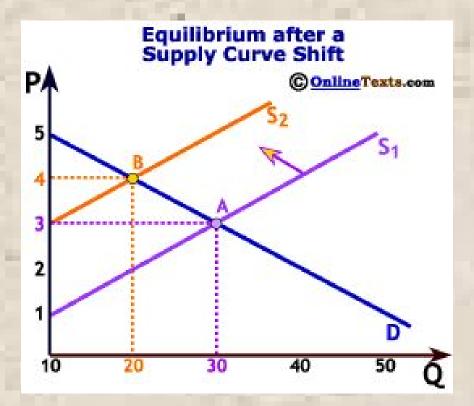

- A change in any variable other than price that influences quantity supplied produces a *shift in the supply curve* or a change in supply.
- Factors that shift the supply curve include:
  - Change in input costs
  - Increase in technology
  - Change in size of the industry

## Shift in the Supply Curve

For an given rental price, quantity supplied is now lower than before.

# **Equilibrium After a Supply Shift**

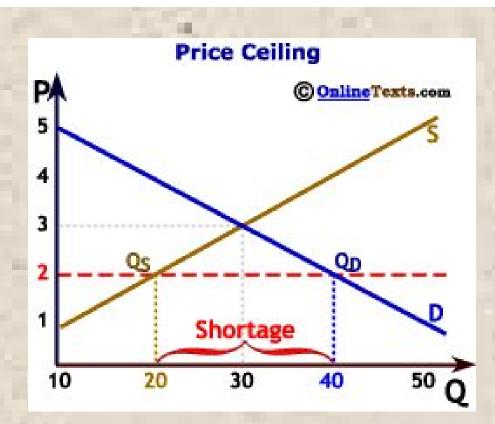

The shift in the supply curve moves the market equilibrium from point A to point B, resulting in a higher price and lower quantity.

# **Price Ceilings & Floors**

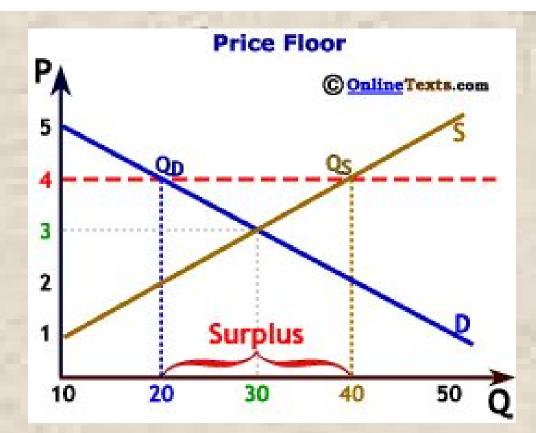

- A *price ceiling* is a legal maximum that can be charged for a good.
  - Results in a shortage of a product
  - Common examples include apartment rentals and credit cards interest rates.
- A *price floor* is a legal minimum that can be charged for a good.
  - Results in a surplus of a product
  - Common examples include soybeans, milk, minimum wage

### **Price Ceiling**

A price ceiling is set at \$2 resulting in a shortage of 20 units.

#### **Price Floor**

A price floor is set at \$4 resulting in a surplus of 20 units.
